

VIDEO TELECONFERENCING SYSTEM

IMPLEMENTATION & DEPLOYMENT PLAN

Portfolio Sample — Demonstration Only

Prepared By: Sandrina Mosley

Sample VTC implementation and deployment plan.

1. Business and Room Requirements

Define business use cases, meeting types, room capacity, seating layout, display requirements, camera coverage, microphone coverage, accessibility needs, power availability, cabling, and network connectivity.

2. VTC Architecture

Document the proposed VTC architecture, including room endpoints, cameras, microphones, displays, control systems, collaboration-platform connectivity, enterprise network services, and management components.

3. Endpoint and Room Equipment

Identify the required VTC endpoints, room displays, cameras, microphones, speakers, room controllers, mounting hardware, power, cabling, and related accessories.

4. Network Readiness

Validate switch-port availability, IP addressing, DNS, DHCP, firewall access, bandwidth, latency, packet loss, jitter, and connectivity to required collaboration services.

5. QoS and Connectivity

Validate quality-of-service requirements and real-time traffic behavior. Confirm appropriate traffic classification, prioritization, latency, jitter, and packet-loss performance.

6. Installation and Configuration

Prepare the room, install and label equipment, connect displays and peripherals, configure endpoints, establish room settings, and validate device operation.

7. Interoperability

Test internal meetings, external participants, supported collaboration workflows, audio/video interoperability, content sharing, and meeting scheduling.

8. Functional Testing

- Power-on and endpoint initialization
- Network connectivity
- Display operation
- Camera operation and framing
- Microphone pickup

- Speaker output
- Mute/unmute
- Meeting join
- Content sharing
- External participant connectivity
- Meeting termination

9. User Acceptance Testing

Business users validate normal meeting scenarios, including scheduling, joining, audio/video, content sharing, room controls, and overall usability. Critical defects must be resolved before production acceptance.

10. Training

Provide end-user training for meeting controls and basic troubleshooting. Provide IT support training covering endpoint, audio/video, network, configuration, and escalation procedures.

11. Production Cutover

Complete final readiness checks, perform a production validation meeting, confirm audio/video and content sharing, release the room for production use, and monitor initial meetings.

12. Support and Maintenance

Establish ongoing monitoring, incident troubleshooting, equipment replacement, software/firmware maintenance, configuration management, documentation updates, and user support.
